

REGISTRO

A Direção do Laboratório de Ciências do Mar da Universidade Federal do Ceará, com o presente registro, exprime o seu júbilo pelo transcurso do 10.^º aniversário de criação do órgão.

Criado pela Resolução n.^º 96 , de 2 de dezembro de 1960 , como Estação de Biologia Marinha da Universidade do Ceará, na categoria de Instituto Aplicado, mudou, por força da Reforma Universitária implantada em 1969 , de denominação e de *status*, passando a Laboratório de Ciências do Mar da Universidade Federal do Ceará, na categoria de Órgão Suplementar.

Ao fazer êste registro, a Direção do Laboratório de Ciências do Mar experimenta prazer em poder expressar a sua gratidão àqueles todos que contribuíram para a sua criação e que deram o seu decidido apoio ao seu funcionamento. De modo especial êste agradecimento é dirigido ao Reitor Antônio Martins Filho, criador do órgão e que não lhe regateou apoio; ao Dr. Rui Simões de Menezes, autor da idéia de sua criação; ao saudoso Professor Raimundo Renato de Almeida Braga e ao Dr. Prisco Bezerra, aliados da primeira hora e grandes incentivadores; ao Professor Raimundo Walnir Chagas, autor dos instrumentos que permitiram a sua institucionalização; ao Reitor Fernando Leite, pelo apoio emprestado durante o seu mandato.

Por fim, a Direção do Laboratório de Ciências do Mar resta satisfeita por constatar, sem falsa modéstia, que o órgão, nos seus primeiros dez anos de funcionamento, justificou, de maneira plena, a sua criação e a sua existência.

REGISTER

The Director of the Laboratório de Ciências do Mar da Universidade Federal do Ceará through this register expresses his satisfaction for the tenth anniversary of the foundation of this Institution.

Created by Resolution n.^º 96 , of December 2 , 1960 , under the name of Estação de Biologia Marinha da Universidade do Ceará, in the grade of an Applied Institute, changed, according to the terms of University Reform of 1969 , of denomination and *status*, becoming Laboratório de Ciências do Mar da Universidade Federal do Ceará, with the grade of a Supplementary Organ.

With this register the Director of the Laboratório de Ciências do Mar has the pleasure of expressing his gratitude to all those that contributed to its foundation, and that gave their effective support to its functioning.

In special, this gratitude is directed to Rector Antônio Martins Filho, founder of the Organ, to which he presented all his support; to Rui Simões de Menezes, author of the idea of its foundation; to the late Prof. Raimundo Renato de Almeida Braga and to Doctor Prisco Bezerra, allied from the beginning and great incentives; to Prof. Raimundo Walnir Chagas, author of the legal procedures that permitted its officialization; to the Rector Fernando Leite, for the support given during his mandate.

Finally, the Director of the Laboratório de Ciências do Mar is satisfied to verify, without false modesty, that the organ in its first ten years of functioning, totally justified its creation and existence.

INVESTIGATIONS ON THE WHALING SEASONS 1964 - 1967, OFF NORTHEASTERN COAST OF BRAZIL

Melquiades Pinto Paiva

Laboratório de Ciências do Mar
Universidade Federal do Ceará
Fortaleza — Ceará — Brasil

Bento Fradique Grangeiro

Divisão de Recursos Pesqueiros
Superintendência do Desenvolvimento do Nordeste
Recife — Pernambuco — Brasil

Whaling off northeastern coast of Brazil is seasonal, and comprises tropical waters of Western South Atlantic (Whaling area A SW).

The only whaling enterprise in this Brazilian area is based at Costinha (latitude 6°05'45"S — longitude 34°51'28"W), on the left shore of the mouth of Paraíba do Norte River (State of Paraíba).

In continuation to our investigations on whaling in northeastern Brazil (Paiva & Grangeiro, 1965), the seasons 1964-1967 are here analysed.

In spite that all known species of the families Balaenopteridae and Physeteridae are represented in Brazil, only the species *Balaenoptera borealis* (Lesson), *Balaenoptera acutorostrata* Lacépède, *Balaenoptera musculus* (Linnaeus), *Megaptera novaeangliae* (Borowski) and *Physeter catodon* Linnaeus were caught during the 1964-1967 whaling seasons off northeastern Brazil. Common names of these species, in English and Portuguese, are listed in table I.

In the Brazilian northeastern, whaling seasons coincide with the occurrence of the herds in the area studied, the whaler(s) making daily trips to the fishing grounds (Grangeiro, 1962).

General data on whaling seasons 1964-1967, off the northeastern coast of Brazil, are found in tables II and III.

Acknowledgments: The authors are most grateful to "Companhia de Pesca Norte do Brasil", for the data analysed in this paper.

OBSERVATIONS ON SEI WHALE

This species was always predominant in the whale catches off northeastern Brazil (Paiva, 1961; Paiva & Grangeiro, 1965). However, this was not true for the 1966-1967 seasons, when it was in second place, while the minke whale was foremost (table IV).

In the 1964-1967 seasons, the participation of the sei whale in the total catches was progressively decreasing, with a maximum of

T A B L E I

Common and scientific names of whales caught off Northeastern coast of Brazil, during the whaling seasons 1964-1967.

| Common names | | Scientific names |
|----------------|------------------|--|
| English | Portuguese | |
| sei whale | baleia espadarte | <i>Balaenoptera borealis</i> (Lesson) |
| minke whale | baleia mirim | <i>Balaenoptera acutorostrata</i> Lacépède |
| blue whale | baleia azul | <i>Balaenoptera musculus</i> (Linnaeus) |
| humpback whale | baleia preta | <i>Megaptera novaeangliae</i> (Borowski) |
| sperm whale | cachalote | <i>Physeter catodon</i> Linnaeus |

T A B L E III
Data concerning the whaling seasons 1964-1967, off Northeastern coast of Brazil.

| Years | Whaling seasons | | Whalers in operation | | Daily whaler voyages | | Whales | | Percentage of the catches | Catch per voyage | | |
|-------|------------------|----------------|----------------------|-----|----------------------|-----|--------|--------|---------------------------|------------------|--|--|
| | beginning ending | | total | | no catch | | caught | | | | | |
| | June, 18th | October, 23rd | 127 | 123 | 13 | 114 | seen | caught | | | | |
| 1964 | June, 18th | October, 18th | 127 | 123 | 24 | 99 | 613 | 304 | 49.6 | 2.39 | | |
| 1965 | June, 14th | November, 28th | 123 | 161 | 26 | 135 | 535 | 229 | 42.8 | 1.86 | | |
| 1966 | June, 7th | November, 25th | 161 | 164 | 19 | 145 | 1,071 | 448 | 41.8 | 2.78 | | |
| 1967 | June, 14th | November, 14th | 164 | - | - | - | 1,315 | 563 | 42.8 | 3.43 | | |

Remark: the whaler Daishin Maru 1 operated in the seasons 1964-1965 and the whaler Koyo Maru in the seasons 1966 - 1967.

84.2% in 1964, and a minimum of 9.7% in 1967 (table IV), not reaching values of over 90.0%, like the ones registered in the 1960-1963 seasons (Paiva & Grangeiro, 1965).

The same fact was observed, in connection with the killings of the species, given in blue whale units (B.W.U.), with a maximum of 42.7 in 1964, and a minimum of 9.2 in 1967 (table IV). In the 1960-1963 seasons, the B.W.U. values corresponding to this species, were also decreasing, with a maximum of 83.3 in 1960, and a minimum of 42.2 in 1963 (Paiva & Grangeiro, 1965).

Sei whale killings per trip were decreasing in number of individuals, as well as in B.W.U., with a maximum in 1964 (2.01 whales and 0.34 B.W.U.), and a minimum in 1967 (0.33 whales and 0.05 B.W.U.), as per data on table IV. In the 1960-1963 seasons, such values were always superior in whale numbers, and at least, equal to the maximum B.W.U. registered in 1964 (Paiva & Grangeiro, 1965).

The data in discussion suggest a progressive sei whale population reduction off northeastern Brazil.

For each whaling season in study, there was a predominance of males over females, in the killings of sei whale (table V). The same fact was also verified in the 1960-1963 seasons (Paiva & Grangeiro, 1965). The data available do not permit to draw the sex-ratio in the stock of this species, for the killings were selective, due to prohibition of hunting females accompanied by their calves. However, in the killings effected, the sex-ratio was 1.7:1.0 in 1964, 1.5:1.0 in 1965, 1.1:1.0 in 1966, and 1.3:1.0 in 1967.

In general, during the months from July to September, when higher sei whale captures were registered, males predominated over females; although it is not possible to conclude that males reach the whaling grounds before females it is likely that they leave them first, returning to their origin waters (table V). Similar observations were also made for the 1960-1963 seasons (Paiva & Grangeiro, 1965). By November, the sei whale is no longer present off the brazilian northeastern (table V).

Sei whale catch per whaler trip during the 1964-1967 season months (table VI), suggests a higher relative abundance during the months from July to September. The same is also indicated by the 1960-1963 seasons (Paiva & Grangeiro, 1965).

Average length⁽¹⁾ data on sei whales captured in the 1964-1967 seasons, are presented in table VII.

Mean lengths of sei whale females were always larger than that of males, during all seasons analysed. This fact was also registered

TABLE III

Monthly data concerning the whaling seasons 1964-1967, off Northeastern coast of Brazil.

| Years | Months | Daily whaler voyages | | | Whales | | Percentage of the catches | Catch per voyage |
|-------|-----------|----------------------|----------|------------|--------|--------|---------------------------|------------------|

| | blue whale | 1 | 0.4 | 1.0 | 0.01 | 0.01 |
| | sperm whale | 14 | 6.1 | 7.0 | 0.11 | 0.06 |
| Total of the season | | 229 | 100.0 | 60.2 | 1.86 | 0.49 |
| 1966 | sei whale | 73 | 16.3 | 12.2 | 0.45 | 0.08 |
| | minke whale | 351 | 78.3 | 140.4 | 2.18 | 0.87 |
| | sperm whale | 24 | 5.4 | 12.0 | 0.15 | 0.07 |
| Total of the season | | 448 | 100.0 | 164.6 | 2.78 | 1.02 |
| 1967 | sei whale | 55 | 9.7 | 9.2 | 0.33 | 0.05 |
| | minke whale | 475 | 84.4 | 190.0 | 2.90 | 1.16 |
| | humpback whale | 13 | 2.3 | 5.2 | 0.08 | 0.03 |
| | sperm whale | 20 | 3.6 | 10.0 | 0.12 | 0.06 |
| Total of the season | | 563 | 100.0 | 214.4 | 3.43 | 1.30 |

- (1) — The length measure considered in this paper was taken in the plane of symmetry, from the tip of the head to the fork of the caudal fin.
(2) — Sea areas codification, effected in agreement with FAO (1968), for 10 minutes side squares. Let us take, for instance, position 60°05'S — 34°13'W, and see its codification in the 10 minutes side square:

| elements | code |
|------------------------|-------|
| 10 minutes side square | 1 |
| southwest quadrant | 3 |
| latitude 60°05'S | 6/00 |
| longitude 34°13'W | 34/10 |

The square corresponding to the position exemplified is the following: 1.3.6/00.34/10.

TABLE V

Monthly data concerning the species caught by sexes, in the whaling season 1964-1967, off Northeastern coast of Brazil.

| | November | — | 4.46 | — | — | 0.37 | 4.83 |

for the 1960-1963 seasons (Paiva & Grangeiro, 1965).

In general, the mean lengths of males and females killed in the 1964-1967 seasons were inferior to those recorded for the 1960-1963 seasons (Paiva & Grangeiro, 1965), the same happening when both sexes are together analysed.

Mean length distribution of sei whales by sexes in the 1964-1967 season months shows no definite tendency, as already observed in the 1960-1963 seasons (Paiva & Grangeiro, 1965).

The distribution of sei whale killings by sea areas ⁽²⁾, during the 1964-1967 seasons (tables X to XIII), does not show any tendency, being of an aleatory nature. In the analysed whaling seasons, sei whale killing grounds were comprised between the following latitudes and longitudes: in 1964 — from 6°00' to 7°20'S, and from 34°00' to 34°40'W; in 1965 — from 6°30' to 7°30'S, and from 34°00' to 34°50'W; in 1966 — from 6°10' to 7°40'S, and from 33°20' to 34°40'W; in 1967 — from 6°30' to 8°10'S, and from 33°40' to 34°50'W.

OBSERVATIONS ON MINKE WHALE

In the 1966-1967 seasons, this species became predominant in the whale captures off northeastern Brazil (table IV), taking the foremost place previously occupied by the sei whale. In the 1960-1963 seasons, the minke

whale was seldom captured (Paiva & Grangeiro, 1965).

From the 1964 season onward, the participation of this species in the whale killings was progressively increasing, with a minimum of 14.5% in 1964 and a maximum of 84.4% in 1967; the same fact was observed in connection with the killings given in B.W.U., with a minimum of 17.6 in 1964, and a maximum of 190.0 in 1967 (table IV). In the 1960-1963 seasons, the highest killings of this species occurred in 1960, when it represented 2.1% of the captures, and 4.4 B.W.U. (Paiva & Grangeiro, 1965).

Minke whale killings per whaler trip were increasing in number of individuals, as well as in B.W.U., with a minimum in 1964 (0.35 whales and 0.14 B.W.U.) and a maximum in 1967 (2.90 whales and 1.16 B.W.U.), as per data on table IV. Such values are extremely superior to the ones observed in the 1960-1963 seasons (Paiva & Grangeiro, 1965).

In each whaling season now analysed, females predominated over males in the killings of minke whales (table V). In these killings, the sex-ratio was 0.6:1.0 in 1964, 0.7:1.0 in 1965, 0.4:1.0 in 1966, and 0.5:1.0 in 1967, thus suggesting a higher minke whale females abundance off northeastern Brazil.

Minke whale captures per whaler trip in 1964-1967 season months (table VI) were increasing, at least until October, suggesting a

| | | | | | | 6 | 19 | 41 |

higher relative abundance during the months from September to November.

Table VIII presents mean length data on minke whales captured in the 1964-1967 seasons. Excepting the year of 1965, smaller mean lengths for males than for females are registered. The mean length monthly distribution maintains, in general, certain uniformity, females having larger sizes.

The distribution of minke whale killings by sea areas during the 1964-1967 seasons (tables XIV to XVII), shows some concentrations, although not well defined. In the whaling seasons analysed, minke whale killings were effected on the areas comprised between the following latitudes and longitudes: in 1964 — from 6°40' to 7°10'S, and from 34°10' to 34°40'W; in 1965 — from 6°30' to 7°40'S, and from 34°10' to 34°50'W; in 1966 — from 6°10' to 7°50'S, and from 33°50' to 34°50'W; in 1967 — from 6°30' to 7°50'S, and from 33°40' to 34°50'W.

OBSERVATIONS ON BLUE WHALE

A single blue whale individual was captured during the whaling seasons 1964-1967 off northeastern Brazil; this occurred in September, 1965, when a female measuring 27.30 m in length was captured in area 1.3.6/40.34/20 (tables, IV, V, VI, IX, and XVIII).

OBSERVATIONS ON HUMPBACK WHALE

During the 1964-1967 whaling seasons off northeastern Brazil, humpback whales were only captured in 1967, with a total killing of 13 individuals, representing 2.3% of the catches, and 5.2 B.W.U., with a capture per whaler trip of 0.08 whales, and 0.03 B.W.U. (table IV).

These captures were effected during the months from July to October, males predominating over females (tables V and VI), the

| Totals | 4 | — | — | — | — | — | — | — | — | — | — | 5 | 10 |
| | 1 | — | — | — | — | — | — | 7 | 17 | 8 | — | — | 10 |

latter with larger mean length than the former (table IX).

The killing ground was comprised between latitudes $6^{\circ}50'$ and $7^{\circ}30'S$, and longitudes $34^{\circ}20'$ and $34^{\circ}50'W$ (table XVIII).

OBSERVATIONS ON SPERM WHALE

In the 1964-1967 whaling seasons off northeastern Brazil, sperm whale captures were rather small, reaching a maximum of 24 individuals in 1966. Other maximum values registered are: percentage of total capture — 6.1% in 1965; killings in B.W.U. — 12.0 in 1966; killings per trip — 0.15 sperm whales, corresponding to 0.07 B.W.U., in 1966 (table IV).

The killings were random monthly distributed during the whaling seasons, females predominating over males in 1965 and 1966, balance occurring between both sexes in 1967, and only males been caught in 1964 (table V).

Killings per whaler trip data do not show any tendency, in their monthly variation (table VI).

In the seasons when killings for both sexes were recorded, males mean lengths were superior to those of females (table IX).

The killing ground was comprised between the following latitudes and longitudes: in 1964

— from $6^{\circ}50'$ to $7^{\circ}10'S$, and from $34^{\circ}10'$ to $34^{\circ}40'W$; in 1965 — from $6^{\circ}40'$ to $7^{\circ}20'S$, and from $34^{\circ}10'$ to $34^{\circ}40'W$; in 1966 — from $6^{\circ}20'$ to $7^{\circ}20'S$, and from $33^{\circ}40'$ to $34^{\circ}40'W$; in 1967 — from $6^{\circ}40'$ to $7^{\circ}50'S$, and from $34^{\circ}00'$ to $34^{\circ}40'W$ (table XVIII).

FINAL CONCLUSIONS

In the two last whaling seasons analysed (1966-1967), some facts are outstanding, such as longer duration of the whaling period, that was extended until late November; the minke whale predominance in the total killings; and the increase of the killing ground areas.
